## Ch11: Swing events and widgets

14 March 2007 CMPT167 Dr. Sean Ho Trinity Western University

#### Review last time

- More on JOptionPane
- Swing vs. AWT, lightweight vs. heavyweight
- Superclass structure of Swing
- Nested and inner classes
- Event handling
  - Delegate classes

# What's on for today

- Event handling
  - Delegate classes
  - Subclasses of ActionEvent
  - Sub-interfaces of EventListener
- Swing widgets
  - JLabel
  - JTextField, JPasswordField
  - JButton
  - JCheckBox, JRadioButton, JComboButton
    - ItemListener interface and ItemEvent class

### **Event handling**

We've seen examples like this:

```
public class Histogram extends JPanel implements
   ActionListener {
   public Histogram() { ...
        widget.addActionListener( this ); ... }; // register
   public void actionPerformed() { ... };
   public static void createAndShowGUI() { ... };
   public static void main() { ... };
}
```

- One class does three functions:
  - main()/createAndShowGUI(): setup window
  - Constructor: create, layout widgets
  - actionPerformed(): event handler

## Delegate classes

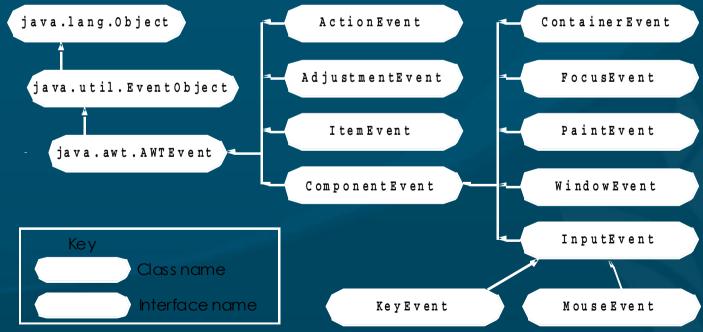

Alternatively: use separate classes

```
public class Histogram extends JPanel {
   public Histogram() { ...
      InputHandler handler = new InputHandler();
      widget.addActionListener( handler ); ... };
   private class InputHandler implements ActionListener {
      public void actionPerformed() { ... };
public class HistogramTest { // in separate file
   public static void createAndShowGUI() { ... };
   public static void main() { ... };
```

Uses inner class to define event handler

### More on event handling

- Event classes are in package java.awt.event
- The ActionListener interface uses the actionPerformed() method on an ActionEvent object

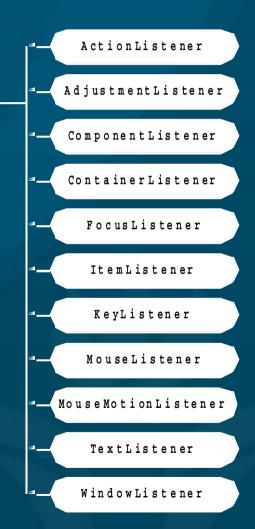

#### Other EventListener interfaces

- ActionListener is but one of many interfaces for handling events
- KeyListener: KeyEvent
  - Listen for keypresses
- MouseListener: MouseEvent
  - Press/release, enter/exit
- MouseMotion: MouseEvent
  - Move, drag

### **JLabel**

- Intended to be a text/image widget describing another component
  - Label1 = new JLabel( "Rotation" );
  - Change the text:
    - habel1.setText("Rot");
  - Add a tooltip:
    - label1.setToolTipText( "Rotation in degrees" );
  - Add an icon:
    - Icon rotIcon = new ImageIcon( "rot.gif" );
    - label1.setIcon(rotIcon);

Testing JLabel

Label with text

with text and icon

### JTextField and JPasswordField

JTextField:

- Testing JTextField and JPasswordField

  Enter text here

  Uneditable text field
- Single-line widget for user to type in text
  - text1 = new JTextField( 10 ); // field width
- Default text:
  - text1 = new JTextField( "Type your name here");
- Disable user editing:
  - \* text1.setEditable( false );
- JPasswordField: subclass that shows only dots
- The ActionListener event handler should use event.getActionCommand() to get the text

#### **JButton**

- User clicks to trigger an ActionEvent
- Several types:
  - Command button, check box, toggle, radio
- Abstract superclass: javax.swing.AbstractButton

```
javax.swing.JComponent

javax.swing.AbstractButton

javax.swing.JButton

javax.swing.ToggleButton

javax.swing.JCheckBox

javax.swing.JRadioButton
```

- Icon rotIcon = new ImageIcon( "rot.png" );
- Icon rotIconDown = new ImageIcon( "rotdn.png" );
- rotButton = new JButton( "Rotate", rotIcon );
- rotButton.setRolloverIcon( rotIconDown );

#### JCheckBox and ItemListener

- JCheckBox uses a different listener interface:
  - wireframe = new JCheckBox( "Wireframe" );
  - MyItemHandler handler = new MyItemHandler();
  - wireframe.addItemListener( handler );
- ItemListener interface uses itemStateChanged() method on an ItemEvent object:

#### **JRadioButton**

- triButton = new JRadioButton( "Triangles", false );
- quadButton = new JRadioButton( "Quads", true );
- tristripButton = new JRadioButton( "Tristrips", false );
- Also uses ItemListener:
  - MyltemListener handler = new MyltemListener();
  - triButton.addItemListener( handler );
- Usually put radio buttons into a ButtonGroup:
  - geomGroup = new ButtonGroup();
  - geomGroup.add(triButton);
  - geomGroup.add( quadButton );
  - geomGroup.add(tristripButton);
- This is in addition to add()ing to the JPanel

### **JComboBox**

- Drop-down list for user to choose one entry
  - private String geom[] = { "Triangles", "Quads", "Tristrips" };
  - geomCombo = new JComboBox( geom );
- Show only three rows at a time:
  - geomCombo.setMaximumRowCount(3);
- Also uses ItemListener interface
- See which entry user selected (0, 1, 2, etc.):
  - geomCombo.getSelectedIndex()

## **Summary of today**

- Event handling
  - Delegate classes
  - Subclasses of ActionEvent
  - Sub-interfaces of EventListener
- Swing widgets
  - JLabel
  - JTextField, JPasswordField
  - JButton
  - JCheckBox, JRadioButton, JComboButton
    - ItemListener interface and ItemEvent class

#### TODO

- Lab4 due tonight
  - OO concepts (sets and vectors)
